Mac Symantec 14.0.1 Installation Instructions

1. Double-click on the Symantec-14.0.1.dmg icon on your hard drive.
2. Uninstall any previous versions of Symantec Antivirus. Use "Symantec Uninstaller" for versions prior to 14.0. For Symantec 14.0, click on the Symantec icon in the menu bar and choose "Uninstall".
3. Double click on the "Symantec Endpoint Protection Installer" icon to start the installer.
4. If on macOS High Sierra, you may be prompted to enable a kernel extension. To authorize the kernel extension, click Allow in the Security & Privacy system preference. You do not need to provide administrator credentials. You only need to authorize the kernel extension once. If you uninstall and reinstall the client, or upgrade your operating system to 10.13 with version 14 installed, you do not need to reauthorize.
5. If the virus definitions do not update automatically, click on the Symantec icon in the menu bar, choose LiveUpdate > Run LiveUpdate.
